

BIO210 Prompt for GELO

Design your own experiment using either plants or the fish. Use the same overall experimental strategy that we did today (titrations using phenolphthalein), but think about an interesting variable that you can add to test. Discuss your proposed experiment with the professor before you leave. You should be prepared to repeat your experiment 3 times. Bring in any materials that you need for the experiment. You will be writing an individual formal lab report on this personalized experiment.
